

# Number's Nest Weekly Challenge

The first National Geographic magazine was published in September 1888.

- A. Assume that the magazine was published every month of each year since the first publication. By the end of this year, how many National Geographic magazines would you have if you had one copy of each magazine? That is, how many magazines would be in the complete collection from September 1888 to December 2023?

- B. Assuming each magazine has 145 pages, how many pages would be in one complete collection?

- C. Assume that each issue is approximately 5mm thick. If you stacked the magazines from one complete collection one on top of the other, would the pile be taller than a double decker bus? Explain your reasoning.

- D. Assume that each National Geographic magazine is 25.5 cm tall. If you lined up all the magazines from one complete collection end-to-end, would they go around a 400 m track?

## Working Out:
